

The Israel Philatelic Services issued three stamps in June 2011 in recognition of achievements in Israeli agriculture. The subjects selected represent fields in which Israel has gained particular status: improving tomatoes through breeding, uses of recycled water and developing agriculture in saline water.

The site chosen to represent research in salinity as an expression of agricultural achievement is that of the dates in lysimeters at the Southern Arava Research and Development.

We take great pride in the team that developed the method- Prof. Uri Shani, Dr. Alon Ben-Gal, Efi Tripler and the R&D technicians, as well as the team at "Crystal Vision" of Kibbutz Samar who were responsible for the computing and controls.
